

Correction to Operator Attestation — envelope 1fdd4a1b-de6d-4e41-9dff-d20937e85b88

Finding

On 2026-09-11, independent review (`LegacyAudit.lean`, run against the sealed `Deployment.lean`, SHA-256 `b6e79d8f3000d99e52d2e0849a81ed432c7264e7a5e9233f6767db471b00af67`, independently reconfirmed under Lean 4.19.0, separate from the 4.33.1 compiler-of-record cited in this attestation) found that the proposition named in this attestation,

None

```
def NoSideChannel : Prop :=
  ∀ r : Receipt, r.executed = true → r.allow = true
```

is not merely unproven from the public surface — it is false, as a closed statement. `Receipt` is unconstrained; `<_, _, allow := false, executed := true>` is a directly constructible value satisfying `r.executed = true` and falsifying `r.allow = true`. `¬ NoSideChannel` is proved with zero axioms (`Apertures.original_NoSideChannel_impossible`). No proof term for `NoSideChannel` can exist, for any deployment, regardless of how the server actually behaves.

This is a correction, not a softening. It does not concern whether the server in fact behaves as described — that is a separate, factual claim, addressed below.

What stands, unaffected

Recital 5 and the first clause of the Attestation are factual claims about the server's behavior, not restatements of the Lean proposition, and are untouched by this correction:

"the server operating <https://theapertures.app> performs no execution of any action except as an `execution_event` written into the hashed and signed body of a receipt whose decision is ALLOW, issued by `POST /api/issue`; that no other execution path exists on that server"

Nothing in the finding above bears on this sentence. It is not a Lean proposition and cannot be true or false as one; it stands exactly as attested. Recitals 1, 2, 4, 7, and 8, and the witnessed ALLOW/DENY receipts of Recital 4, are likewise unaffected — none of them assert `NoSideChannel` holds, only that the file compiles, is unmodified, and that the witnesses are signed.

What is corrected

The Attestation's closing clause.

Current:

"...and that, accordingly, the proposition `NoSideChannel` as defined in `Deployment.lean` holds of the Gate as deployed on the date of this attestation."

This clause is withdrawn. It does not follow from the server-behavior claim that precedes it, and cannot follow from any server-behavior claim: the proposition it names has no proof term, independent of what the server does. The Attestation paragraph is corrected to end at "no other execution path exists on that server," without the "accordingly" clause.

Clause 6.

Current:

"Upon this attestation the sole hypothesis of `Apertures.apertures_accountable` is discharged on the record, and the theorem stands of the Gate as deployed without further condition: every execution at `theapertures.app` in an area of consequence resolves to a principal for whom the predicate `O` of `A50.lean` `v4` holds at the moment of decision."

This clause is withdrawn in full. The discharge it describes did not occur: an attestation of server behavior, however true, cannot discharge a Lean hypothesis that has no satisfying instance. `Apertures.apertures_accountable` remains exactly what it was before this attestation — a true, zero-axiom conditional theorem of the sealed `v1` model — and remains undischarged for that model. This correction does not assert the server is unaccountable; it asserts that this instrument did not, and could not, complete the discharge it claimed.

Effect

Discharge of accountability for the Gate now passes to the successor model's own attestations — the model to be named as file of record under `a50/`, carrying evidence obligations (`CheckersSound`, `DecisionsFollowChecker`, `NoSideChannel-analogue`, `CoversActualExecutions` or equivalent) that are individually satisfiable, not universally false as `NoSideChannel` was found to be. Those attestations are a separate instrument, to be executed once that model is selected, committed, and — per the engineering item on the decision line — once the Gate's decision path itself reads a server-held ledger rather than appointment state supplied in the request.

What this does not do

It does not retract Recitals 1–2, 4, 7–8, or the witnessed receipts. It does not edit or reseal `Deployment.lean` — the sealed `v1` file, hash `b6e79d8f...af67`, remains unrevised, exactly as sealed 2026-09-09. It does not assert or imply that the server executed anything outside a signed ALLOW receipt — no evidence bearing on that question was found or is claimed here. It does not by itself attest anything of a successor model.
